Simulation of sensors on IBM Watson IoT platform

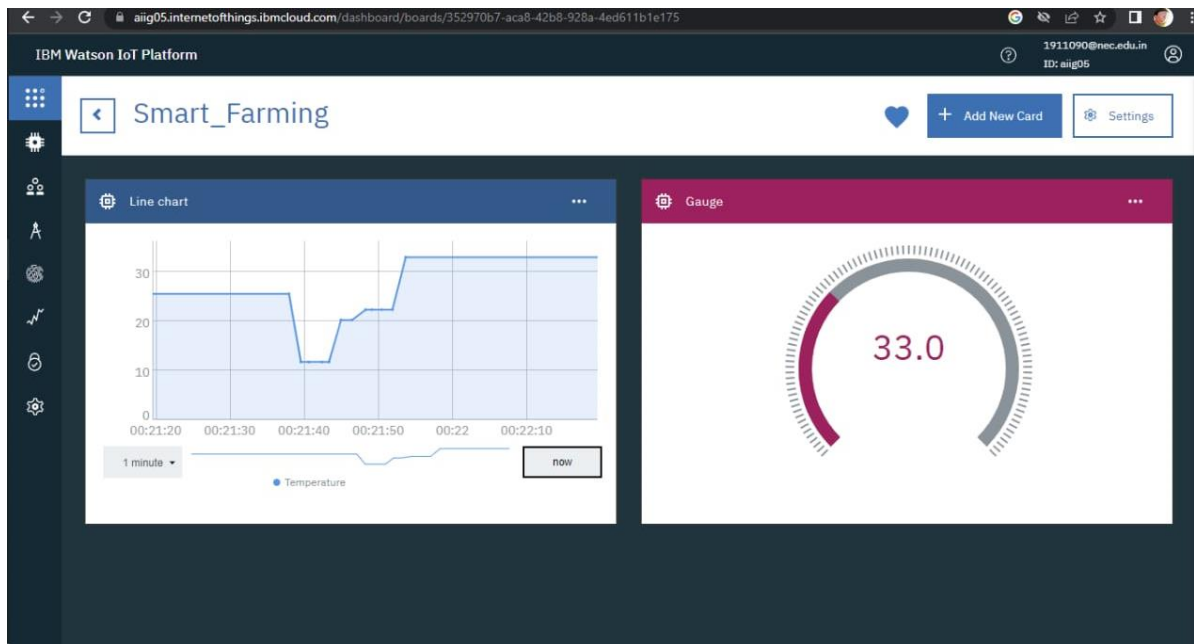

The WOKWI simulation interface shows an ESP32 microcontroller connected to a DHT22 temperature and humidity sensor. The sketch code on the left defines the sensor pin (DHTPIN 15) and type (DHTTYPE DHT22). It sets up an MQTT client to connect to the IBM Watson IoT platform using the following credentials:

- ORG: "aig05"
- DEVICE_TYPE: "Farmer_IoT"
- DEVICE_ID: "1911090"
- TOKEN: "1911090abcdegh"

The console output on the right shows the sensor data being published to the MQTT topic "iot-2/evt/Data/fmt/json". The payload is {"temp":24.00,"moisture":6}.

The IBM Watson IoT Platform dashboard shows the 'Recent Events' tab for device 1911090. The table displays a stream of data events with temperature and moisture values.

Event	Value	Format	Last Received
Data	["temp":24,"moisture":0]	json	a few seconds ago
Data	["temp":24,"moisture":31]	json	a few seconds ago
Data	["temp":24,"moisture":39]	json	a few seconds ago
Data	["temp":24,"moisture":12]	json	a few seconds ago
Data	["temp":24,"moisture":31]	json	a few seconds ago
